

Technical task

The challenge is to demonstrate your capabilities and skills using CakePHP 2 framework.

You can use any frontend libraries & frameworks, but you may wish to demonstrate your knowledge of writing custom code.

Please do this task using your own techniques – we are keen to see how you would tackle this.

Requirements

- Create a CakePHP (*use any version 2.x*) app for displaying blog posts. There should be “Archive” page where all blog posts are and “Submit Article” page where you are able to post article to this blog.
- Blog functionality must be created as a plugin.
- Send email to admin when blog post is submitted.
- Create a shell to import 5 articles from JSON placeholder API (<https://jsonplaceholder.typicode.com/posts>). Add instructions for this in case client wants to use cron job.
- Frontend must be responsive.
- Use Schema markup where it applies.
- Use GIT and create public repo for this.

Bonus

- It is a bonus if you do the article submit with Ajax or/and add some kind of article image cropper for frontend.
- If you comment your code and leave a readme.
- If you use Caching.

Use good programming practice!

Provide a link to us after completion. We must be able to pull your project and test it.

May the odds be ever in your favor means!
